

## **Abstract**

**Title:** Pupils' Attitudes to Physical Education at a Primary School in Slaný

**Objectives:** The primary aim of this study is to find out how pupils of the chosen primary school in Slaný perceive PE and to determine factors, which influence their attitudes.

**Methods:** The study took place at a chosen primary school in the city of Slaný and 99 pupils from 6<sup>th</sup> to 9<sup>th</sup> grade took part in it. The children were asked to complete an electronic questionnaire consisting of 23 questions, which was loaded to the website of the lower secondary school department. Before publishing, the questionnaire was consulted with the head of this bachelor thesis and verified by a few other people. For the theoretical part, some secondary data from professional articles, literature and websites were collected and analysed.

**Results:** According to the results, most children have a positive attitude to PE. It brings them joy and relief from sitting at a desk as in the other subjects. There are also pupils, who have negative feelings about PE. Not all the students have the same skills and aptitudes in sports and those who are not as good at some activities have certain struggles during the classes. Their motivation is affected mainly by the fact that they are evaluated for their performance and can get a poor grade.

**Keywords:** attitudes, physical education, children, sport
